#### Definition of Weighted Average Maturity (1) & (2)

(1) This weighted average maturity calculation uses the SEC Rule 2a-7 definition for stated maturity for any floating rate instrument held in the portfolio to determine the weighted average maturity for the pool. This Rule specifies that a variable rate instrument to be paid in 397 calendar days or less shall be deemed to have a maturity equal to the period remaining until the next readjustment of the interest rate.

(2) This weighted average maturity calculation uses the final maturity of any floating rate instruments held in the portfolio to calculate the weighted average maturity for the pool.

### **Economic Commentary**

As events in the first quarter in both the U.S. and Europe threatened to derail the rally in risk assets, accommodative support from central banks benefited U.S. stock markets, which reached multi-year highs. The Standard & Poor's 500 Index gained 10.6% for the quarter and closed at a record high for the first time since 2007. In the U.S., lawmakers were able to avert the potential cliff in fiscal spending at the beginning of the year and markets were resilient despite additional concerns regarding automatic spending cuts, referred to as sequestration. U.S. markets experienced some weakness when minutes of the January Fed meeting revealed that the current \$85 billion in monthly bond purchases may be scaled back earlier than anticipated. However, markets rebounded again when Fed Chairman Bernanke made several statements during the quarter that defended the asset purchases program and maintained the Fed's accommodative policy dependence on economic data. While the pace of asset purchases may not remain at \$85 billion per month all year, the Fed made it clear that policy will stay accommodative for a very long time. The U.S. economy displayed signs of resilience in the first quarter, despite headwinds from fiscal policy. With the decline in the savings rate and the phasing in of sequestration cuts, it remains to be seen if this positive momentum can be sustained. The personal savings rate is at its lowest level since late 2007 and explains the continued strength in personal spending in the face of higher taxes. Measures of consumer confidence turned lower in the first quarter as the combination of increased taxes, sequestration headlines, and higher gasoline prices overwhelmed strong equity market performance.

Accommodative central bank policy appears to be working. In the U.S., the wealth effect of improving financial markets and housing prices seems to be offsetting the impact of fiscal cuts and higher energy prices. While problems in Europe are not resolved, it is clear that policymakers have calmed markets. Geopolitical risks, such as the dissolution of civil society in the Middle East, nuclear arms threat in Iran and North Korea and the potential for trade friction between China and Japan could also derail the currently favorable environment for risk assets. It is anticipated that the Fed will continue to purchase \$85 billion of securities per month through 2013. Only significantly stronger economic growth would change this view. It is believed highly accommodative monetary policy and below trend growth will still be the best environment for financial asset prices.
